Introduction

1. We have chosen Student Management System as Group 06. In this system, I'm creating the "Add Course Details" section. For this, Java language is used and coded in NetBeans.
2. In this program using console-based input/output. It allows the user to:-
 1. Add New Course Details
 2. View All Stored Courses

Key Features Used

1. ArrayList – To store course data dynamically (Course Title, Instructor Name, and Duration). This replaces the use of fixed-size arrays and allows unlimited data entry.
2. if and if-else statements – Used for checking conditions like whether any courses exist before displaying them.
3. switch statement – Used to create a menu-based control panel for selecting options.
4. while loop – Used to repeatedly display the menu until the user decides to exit.
5. User-defined methods – addCourseDetails() and viewAllCourses() make the code organized and modular.
